Top 15 packages by tenant count

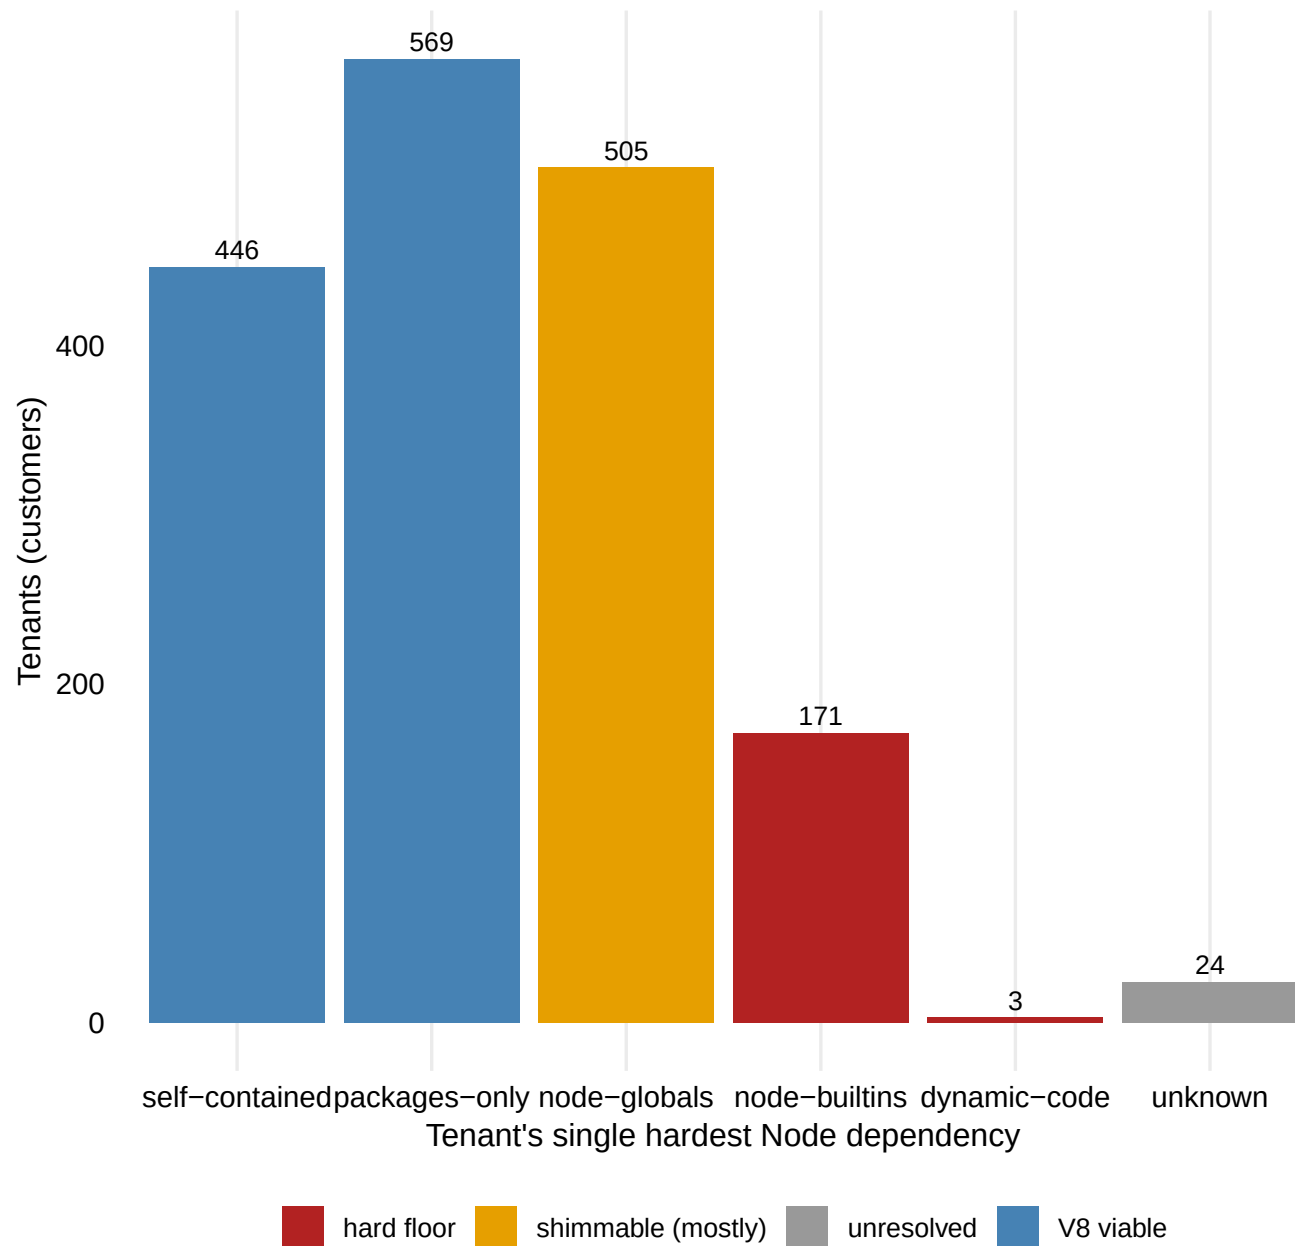

Node runtime feature usage by tenant

General overview. CommonJS module bookkeeping omitted (near zero).
For the V8–viability argument specifically, see the two–panel chart.

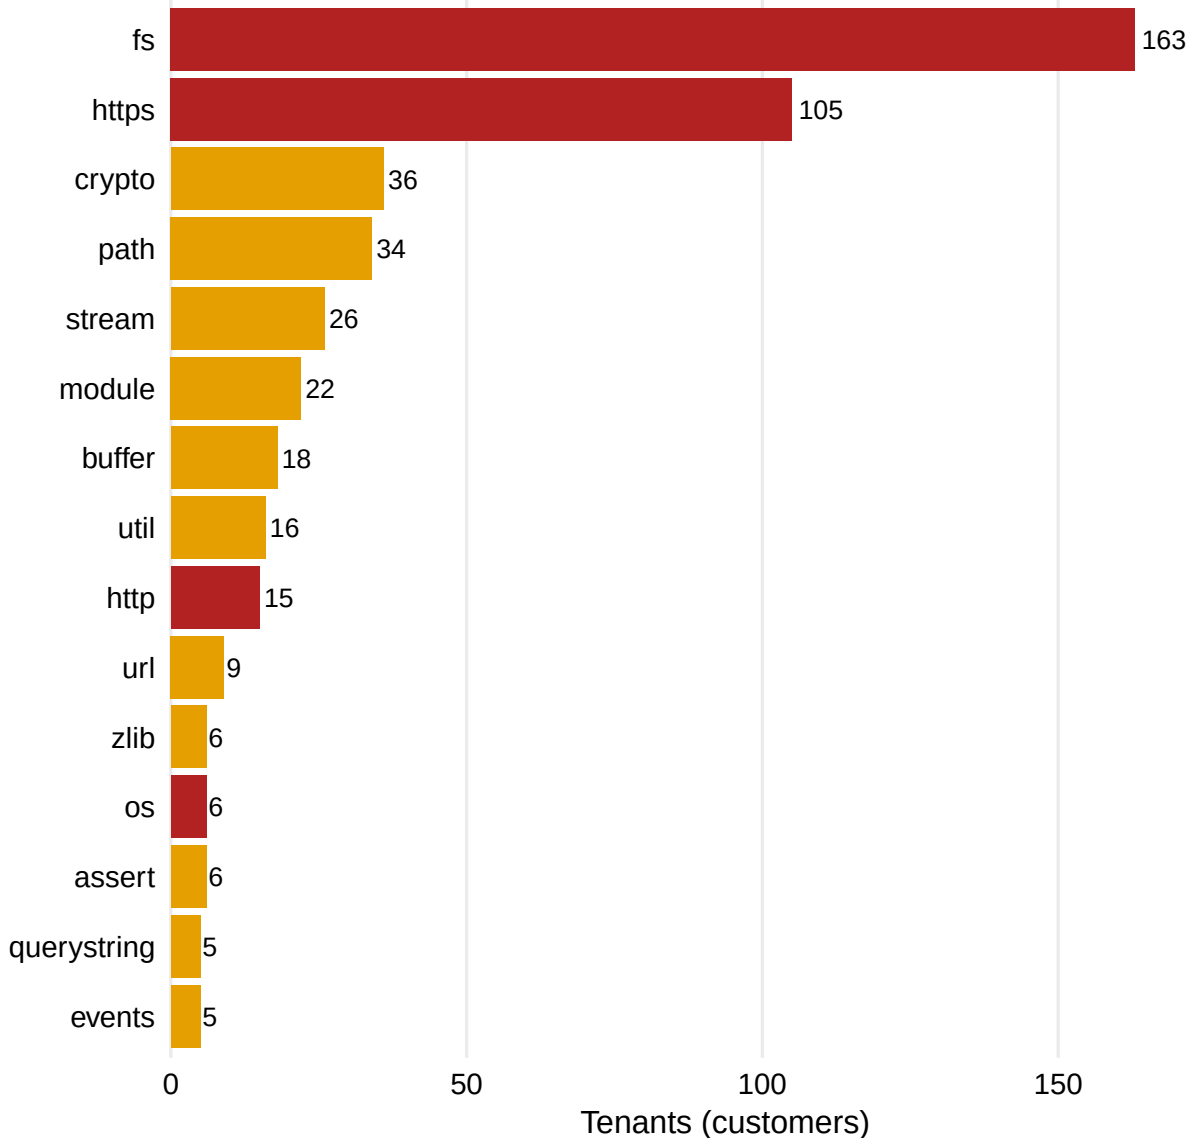

Tenants by their hardest Node dependency

Node builtin usage: hard floor vs. polyfillable

Node builtin module

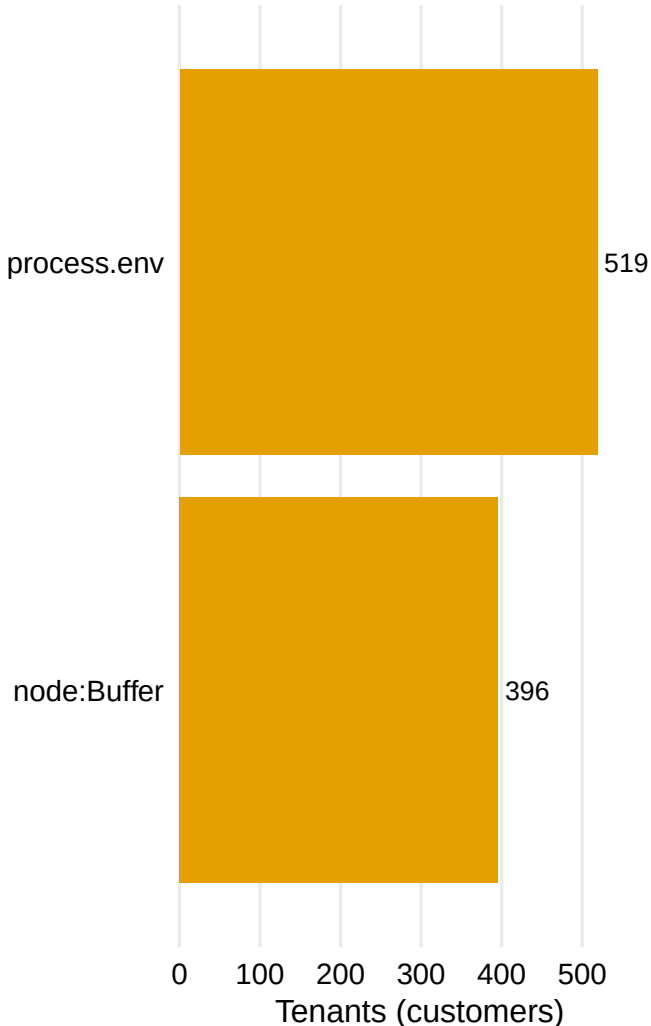

hard floor shimmable (mostly)

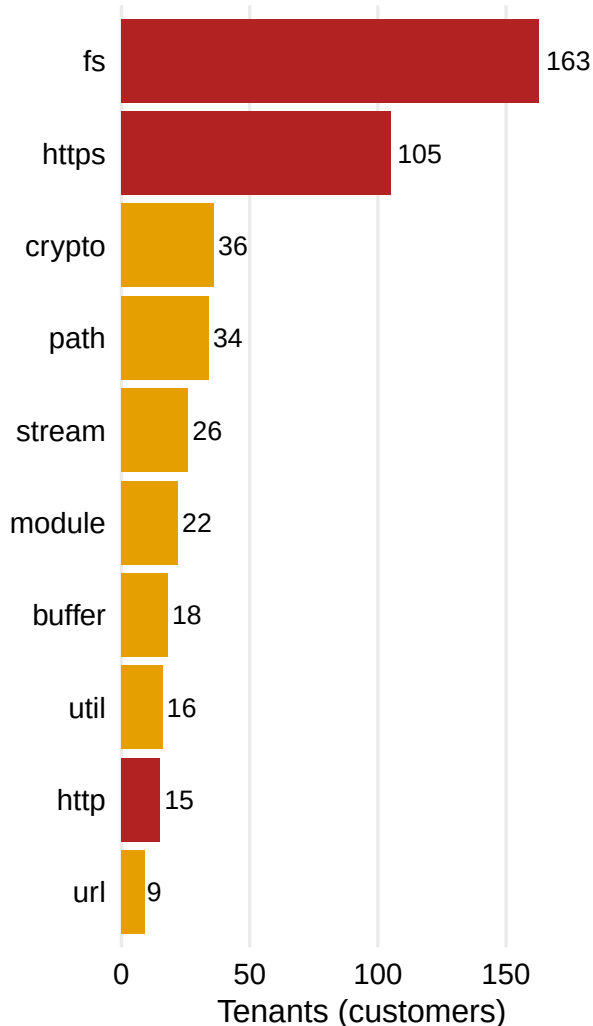

What actually blocks a V8-only runtime

CommonJS module bookkeeping omitted: it is near-universal and not a real blocker

Dominant shimmable globals

Top 10 builtins, hard floor vs.

hard floor shimmable (mostly)

Effect of excluding disallowed behavior from the V8 question

child_process, readline, tty, v8, perf_hooks and dynamic code no longer count against V8 viability, since we would block them under Node too
